I'll turn the idea into a build-ready blueprint: the end-to-end workflow, each user role, inventory rules, dashboard features, forecasting logic, safeguards, and a phased development plan. I'll keep the core principle clear: vendors and godowns enter stock data; farmers do not need accounts on the platform.

The blueprint now covers the full stock lifecycle—including purchases, sales/dispatches, transfers, spoilage, regional reporting, and forecasting. I'm checking the document layout and correcting pagination before sharing the final files.

I've prepared the **final Maha Inventory workflow and app development blueprint** based on your requirements. It explains how the platform works from vendor data entry to government inventory analysis and future agricultural planning.

## Download your project files

**Complete workflow — PDF** 6-page blueprint for reading, sharing and presenting. Download PDF **Editable project document — Word** Modify the explanation, workflow and development plan. Download Word document **System flowchart — PNG image** Easy to copy, share on WhatsApp or insert into a presentation. Download flowchart image

## Final workflow at a glance

{#each [ ["1. Vendor / Godown Registration","Approve wholesale vendors and register their godowns."], ["2. Purchase Entry","Record products purchased from farmers and their quantities."], ["3. Stock Movement","Record sales, dispatches, transfers and spoilage."], ["4. Automatic Inventory","Calculate remaining usable stock by product, godown and location."], ["5. Government Dashboard","Analyse available inventory across participating godowns in Maharashtra."], ["6. Future Demand Forecast","Use historical stock movements and seasonal patterns to estimate future requirements."], ["7. Community Coordination","Government communicates priorities through Gram Panchayats, farmer communities and NGOs."] ] as step,i} {step[0]} {step[1]} {#if i<6} {/if} {/each}

The blueprint also includes the vendor and government dashboards, data fields, inventory calculation rules, forecasting approach, recommended technology, testing and rollout phases.

**My main recommendation:** Build the vendor dashboard and accurate inventory tracking first. Once the system reliably tracks purchases, outgoing stock and

spoilage, the government can use that information to make better-informed agricultural planning decisions.
